ABSTRACT

This article reveals the basics of pedagogical aspects of educational programs that meet world educational standards, which can be the basis for student's independent thinking at the stage of higher education, which is one of the main links of the educational system. Today, in all stages of the education system, foreign curricula are used as a main and auxiliary tool, along with national programs and textbooks, for the formation and expansion of the minds of learners, in teaching and learning. is to reveal advanced pedagogical methods.

KEYWORDS

Modern education, methods, advanced educational technologies, pedagogical tools, foreign educational programs.

INTRODUCTION

No. 421 of the Cabinet of Ministers of the Republic of Uzbekistan dated 06.07.2021 "On approval of the regulation on the procedure for organizing educational activities on the basis of joint educational programs of the Republic of

Uzbekistan and foreign partner higher education organizations" and in order to ensure the implementation of the Decision of the President of the Republic of Uzbekistan dated 20.04.2017 No. PD-2909 "On measures to further develop the

higher education system" in the higher education system It is intended to ensure the implementation and implementation of programs.

Forming the maturity of today's personality and expanding his thinking potential is one of the main criteria provided by the educational system. Since the main task of the education system is to bring the person to perfection and to raise his consciousness to a high level, it is at the level of state policy to implement whatever measures are necessary for this. One of the targeted methods of education is the use of many tools and methods in higher education to teach students to think independently and expand their scientific outlook. The growing young generations of today's technological age are modern young people who have much deeper thoughts than their predecessors, who are well aware of their rights, because they receive education and upbringing through social networks together with family and educational institutions. is forming in itself.

At the same time that our lifestyle is growing together with technology, our youth are also learning, acquiring a profession, and fulfilling social needs in modern ways. They are studying distance learning, trade, finding and finding information, and how to get a job in other countries through the Internet. That's why education requires modernity, and the use of new educational methods and tools is today's way of fulfilling the requirements of today's students. one of the important issues.

In the higher education system, the main goal is to expand the scope of students' knowledge, to complete their professional training at the level of modern requirements, and to use foreign advanced methods, to work in cooperation, to exchange ideas with them, to raise the level of student's knowledge to the level of foreign experiences. Also, to bring the quality of education to the level of world requirements, the direct and indirect use of educational programs of foreign countries, the use of their experiences, will increase the quality of teaching and learning, as well as increase the efficiency to some extent.

At the stage of higher education, only national and experimentally tested methods are used to enable students to express their opinion independently, but it will be more purposeful to bring the methods used in foreign educational institutions and which are highly effective. Cooperation in education, the use of technical tools and teaching methods that affect the improvement of the quality of education and the expansion of the worldview of students is one of the highest goals we aim for. In higher education, it is important to provide tools and literature that influence students to grow and expand their knowledge.

The formation of the knowledge acquired by students in higher education is mainly focused on the scientific worldview, because primary knowledge is formed on the basis of school textbooks through real life examples. This existing knowledge is the basis for acquiring a profession. The existing knowledge is expanded based on the scientific nature of the knowledge that is taught and formed in the minds of students.

The use of foreign methods in harmony with our national concepts will be enriched with modern and foreign qualities.

Today, many professions and industry specialists are disappearing in the society and are being replaced by other professions. Because the higher education system should work together with foreign partners and be ready for innovations and changes in order to produce personnel that meet the requirements of the society. Only then can he meet the demands of the society and the individual. It is the duty of the education sector to keep ahead of the changes in society.

Making students educated and knowledgeable on the basis of contemporary students serves for the development of the state. In foreign partner state educational organizations, students will have the opportunity to exchange experience, improve their skills and further expand their knowledge. Conducting education and upbringing together with nationalism and modernity is carried out based on the development of society and the needs of humanity. Education has always required development and formation. Therefore, problems such as stagnation in education will be solved by international educational organizations exchanging experience with educational institutions of developed countries and using their experiences. It is the need of the hour to set goals at the level of learners' requirements, to determine and organize the necessary tasks based on best practices, so that they can use their time effectively without slowing down their desire to learn.

Expanding the scientific and independent worldview of students, organizing their independent research, in addition to initial theoretical and practical training, creating and encouraging them to work on independently selected research is a method tested in foreign experiences. In this method, the student conducts research on his topic in independent resource centers and laboratories, collects data and conducts experiments. It is necessary to give the necessary guidance to the student in the organization of independent educational work, to jointly analyze the collected data and to give assignments for further processes. The student's independent search is the basis for expanding his knowledge, because in the process of independent data collection, he learns a lot of information, gets acquainted with a lot of literature, and by comparing the newness of the information, the scope of his thinking expands and he can think independently. 'nikma' is formed.

Secondly, another positive aspect of foreign educational programs is that students are provided with theoretical knowledge, only brief information and instructions are given for the completion of assignments and independent experimental work. It is up to the students to find the main information and compare them. The classes held in the auditorium are mostly conducted with modern didactic tools.

Thirdly, one of the pedagogical foundations of the educational programs taught on the basis of world standards is that students independently find solutions to problems, assignments, and

puzzles, prepare for exams independently, and re-submit to students who fail by paying a fee. given It is recommended that the educational process be focused on the financial side, that the students should be more active, independent research, and devoted to education.

Another advantage of foreign educational programs is that the educational process is short-term, an adaptation period is set for students to adapt to the educational process and explore the possibilities of the country of study, the next step is to attend lectures and receive assignments. That is, one academic semester is determined based on the student's capabilities, the duration of subjects and assignments is determined based on the student's capabilities and cannot be extended again. A student who fails to pass by the last deadline will be postponed for the next year. My goal is to encourage students to work diligently on their own and use available resources wisely.

In addition, dual education is widely used in foreign educational programs to expand and shape the worldview of students. The use of dual education assumes that the student directly connects education with practice. That is, to connect theory with practice and to see how the knowledge gained in practice results in the introduction of effective methods and to expand one's worldview. skills and abilities are formed. At the same time, there are opportunities to train students to become employees who can work independently and to ensure their financial situation.

Also, during the educational process, students of higher education collect independent information from mandatory and optional subjects, the main goal of which is to study their independent approach and attitude to each information. Compulsory subjects are mainly specialized subjects and vocational training subjects.

One of the urgent issues in today's intense life is to expand student's outlook in higher education using the methods of using educational programs tested in the above world experiences. It is the main task of the higher education system to encourage students to think independently, to make them able to think deeply, first of all to make them perform independent tasks, to listen to them and to respond regardless of how they think. Therefore, it is aimed to bring foreign programs into education that are suitable for our national education and correspond to the existing conditions, and to implement the criteria that encourage the expansion of the scientific consciousness of students as the basis of educational programs.
